

When you need reinforcement...

and separation – **Think TenCate.**

There are many dangers lurking in our world...
Some visible...some hidden...

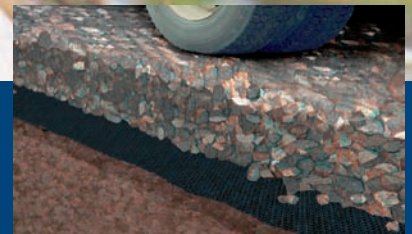

TenCate Geosynthetics is the innovative provider focused on delivering the right solution for a variety of environmental problems. As the world's leading source of geosynthetic materials, we will develop, manufacture, and provide specific solutions for your project.

One of the most difficult challenges engineers worldwide face is the measurement of a product's separation capacity. Now, TenCate accurately quantifies separation by calculating the Separation Factor.

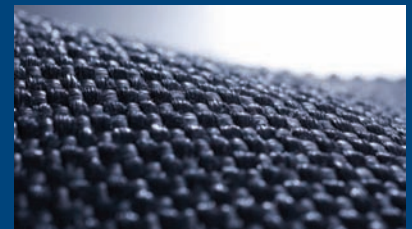

And, proper separation and reinforcement can now be fulfilled simultaneously through the use of only one layer of a High-Performance polypropylene geotextile. Mirafi® HP High-Performance Geotextiles offer an excellent balance of high-tensile strength at low strains for reinforcement, very good hydraulic properties that facilitate filtration and drainage, and high Separation Factors. For a detailed copy of the Separation Factor methodology, please check out our "Tech Note" section at www.mirafi.com or email separationfactor@tencate.com.

At TenCate Geosynthetics, we find solutions for your soil separation and reinforcement problems, protecting you from the dangers you don't see...like bad road conditions caused by weak and failing subgrades.

Think TenCate. TenCate Geosynthetics increases performance, reduces costs, and enables your company to achieve what was once unachievable. For more information call 1-800-685-9990, or visit www.mirafi.com.
